COST 013: Applying Reading Comprehension for Important Social Studies Topics. How to Get Your Child Reading by the End of 2nd Grade. This is my 5th year of teaching and I can honestly say the biggest lesson I have learned is to have patience with my students. Modular presentations are often touted as teaching tools and are used for both elementary and secondary learning. Having a lesson plan is essential to the teacher and should be used for all subjects. Since 1995 there has been the most amazing and exciting discovery in human genetic engineering. At one time in time many people thought we would never make this kind of progress. Some people are now hoping that the first human embryo with genetic modification has been born. In the

past scientists have only been able to change a specific gene by taking a section of DNA, copying it and pasting it into the genome of a cell. In the past it was not possible to insert the entire sequence of DNA so all kinds of errors would be introduced.

Researchers have been able to modify the DNA of mouse embryos and clone them to produce a baby mouse with genetic modification. In the beginning the technology was limited to the lab but now scientists are working to get it to work in human embryos. They believe this new technology will be a huge breakthrough. One of the problems that has been a challenge is that most people think that human beings are made of DNA. As long ago as 1972 scientists discovered that the cell nucleus and cell plasma are both made of different types of protein. Genes for proteins were discovered but people still thought that we were made of DNA. Our cells are made up of proteins, not DNA. The genome of the cell consists of RNA and not DNA. The reason DNA has always been thought to be the building blocks of life is because it has been called the “junk DNA” or non coding parts of the genome. Today scientists are claiming that the “junk DNA” is the most important part of the genome for controlling our gene expression and that the cell nucleus, plasma membrane, and chromosomes are all made up of the same protein. It has now been discovered that humans are made up of proteins, not DNA. The technology being developed to modify the human genome would require many scientists and engineers but if perfected it would change the world and possibly the future of our species. Below is a link to information on how much protein is in a human body and a video showing protein. Protein and Foods. There

are many different kinds of proteins. Each has a different shape, size 82157476af
